

### Combined Diver Temperature Data

Both divers met at the 40 ft decompression rack and progressed to the depth of 205 feet together. During the dive Curt Bowen moved farther into the openings of the vents (slightly warmer temperature readings) while Jim Cutler collected the water samples outside of the vents. Slight increase in temperature was seen by Curt at Vents B through D. The time each sample was collected is given, along with the temperature. The divers' simultaneous descent begins at 40 ft. decompression rack at 8:58 a.m.

Attached Temperature probes for divers 1 and 2 during descent to 205 feet

### Diver 1 Data: Curt Bowen

Yellow highlight indicates diver in air before descent into the pool water. Also returned to the surface after a few minutes and then another descent. Temperature changes in air are due to changing atmospheric conditions. Descent began at 8:46 am. Recording every 30 seconds.

Diver 1 Temperature Graph

### Diver 2 Data: Jim Cutler

Yellow highlight indicates diver in air before descent into the pool water. Temperature changes due to changing atmospheric conditions. Descent began at 8:55 am. Recording every 30 seconds.
