Charlotte Harbor National Estuary Program

The Charlotte Harbor National Estuary Program (CHNEP) is a partnership of citizens, elected officials, resource managers and commercial and recreational resource users working to improve the water quality and ecological integrity of the greater Charlotte Harbor watershed. A cooperative decision-making process is used within the program to address diverse resource management concerns in the 4,700-square-mile study area. Many of these partners also financially support the Program, which, in turn, affords the Program opportunities to fund projects. The entities that have financially supported the program include the following:

U.S. Environmental Protection Agency
Southwest Florida Water Management District
South Florida Water Management District
Florida Department of Environmental Protection
Peace River/Manasota Regional Water Supply Authority
Polk, Sarasota, Manatee, Lee, Charlotte, and Hardee Counties
Cities and Towns of Sanibel, Cape Coral, Fort Myers, Punta Gorda, North Port, Venice, Fort Myers Beach, Winter Haven, and Bonita Springs

Acknowledgements

This document augments and updates the original Coastal Charlotte Harbor Monitoring Network (CCHMN) Standard Operating Procedures (SOPs) approved by the Charlotte Harbor National Estuary Program (CHNEP) Management Conference in March 2014 (CHNEP Technical Report 02-03). It was prepared by Judy Ott, Program Scientist. Many organizations and individuals contributed to the development of the original CCHMN SOPs, as well as these updates. The original CCHMN SOPs were built on the Southwest Florida Water Management District (SWFWMD) *A Long-Term Water Quality Monitoring Design for Charlotte Harbor, Florida* (1995) and the Charlotte Harbor National Estuary Program (CHNEP) *Long Term Monitoring Strategy and Gap Analysis* (2000). The assistance from all those who contribute their field, laboratory and data management expertise toward making the CCHMN a reliable, on-going source of technically sound region-wide estuarine water quality data is greatly appreciated by many. Thank you to each contributor.

Purpose

This purpose of this document is to incorporate updated field, laboratory and data management methods into the Coastal Charlotte Harbor Monitoring Network (CCHMN) Standard Operating Procedures (SOPs). The original *Coastal Charlotte Harbor Monitoring Network Description and Standard Operating Procedures* (CHNEP Technical Report 02-03) were approved by the Charlotte Harbor National Estuary Program (CHNEP) Management Conference on March 19, 2004 (CHNEP, 2004; available at www.chnep.org).

The CCHMN is a regional ambient water quality monitoring partnership that uses consistent methods, based on a probabilistic (random) sampling design, to conduct monthly monitoring throughout the estuaries within the CHNEP.

The CHNEP is a partnership of citizens, elected officials, resource managers and commercial and recreational resource users working to improve the water quality and ecological integrity of the greater Charlotte Harbor watershed. A cooperative decision-making process is used within the program to address diverse resource management concerns in the 4,700-square-mile study area. The CHNEP study area is shown in Figure 1.

Activities in the CHNEP are guided by the *Comprehensive Conservation and Management Plan Update 2013* (CCMP) (CHNEP, 2014; available at www.chnep.org). The CCMP identifies four Priority Problems, with associated Quantifiable Objectives, throughout the study area relating to:

- Water Quality Degradation (WQ),
- Fish and Wildlife Habitat Loss (FW),
- Hydrologic Alterations (HA), and
- Stewardship Gaps (SG).

The CCHMN implements the CCMP Quantifiable Objectives and Priority Actions relating to Water Quality including:

- **WQ-1:** Maintain or improve water quality from year 2000 levels. By 2018 bring all impaired water bodies into a watershed management program such as reasonable assurance or basin management action plan. By 2015, remove at least two water bodies from the impaired list by improving water quality.
- **WQ-2:** By 2020, develop and meet water quality criteria that are protective of living resources for dissolved oxygen, nutrients, chlorophyll *a*, turbidity, salinity and other contaminants.
- **WQ-B:** Continue collecting consistent water quality data from throughout the study area used to assess impairments, determine Total Maximum Daily Load (TMDL) limits and develop Basin Management Action Plans (BMAPs). Support key programs such as the CCHMN, partner's long-term fixed stations and volunteer monitoring programs.
- **WQ-C:** Use tools such as geographic information systems, integrated ground and surface water quality models and pollutant loading models to identify water quality problems and select less polluting alternatives.
- **WQ-G:** Develop and implement water quality criteria that are protective of living resources for dissolved oxygen, nutrients, chlorophyll *a*, turbidity, salinity and other constituents as applicable.

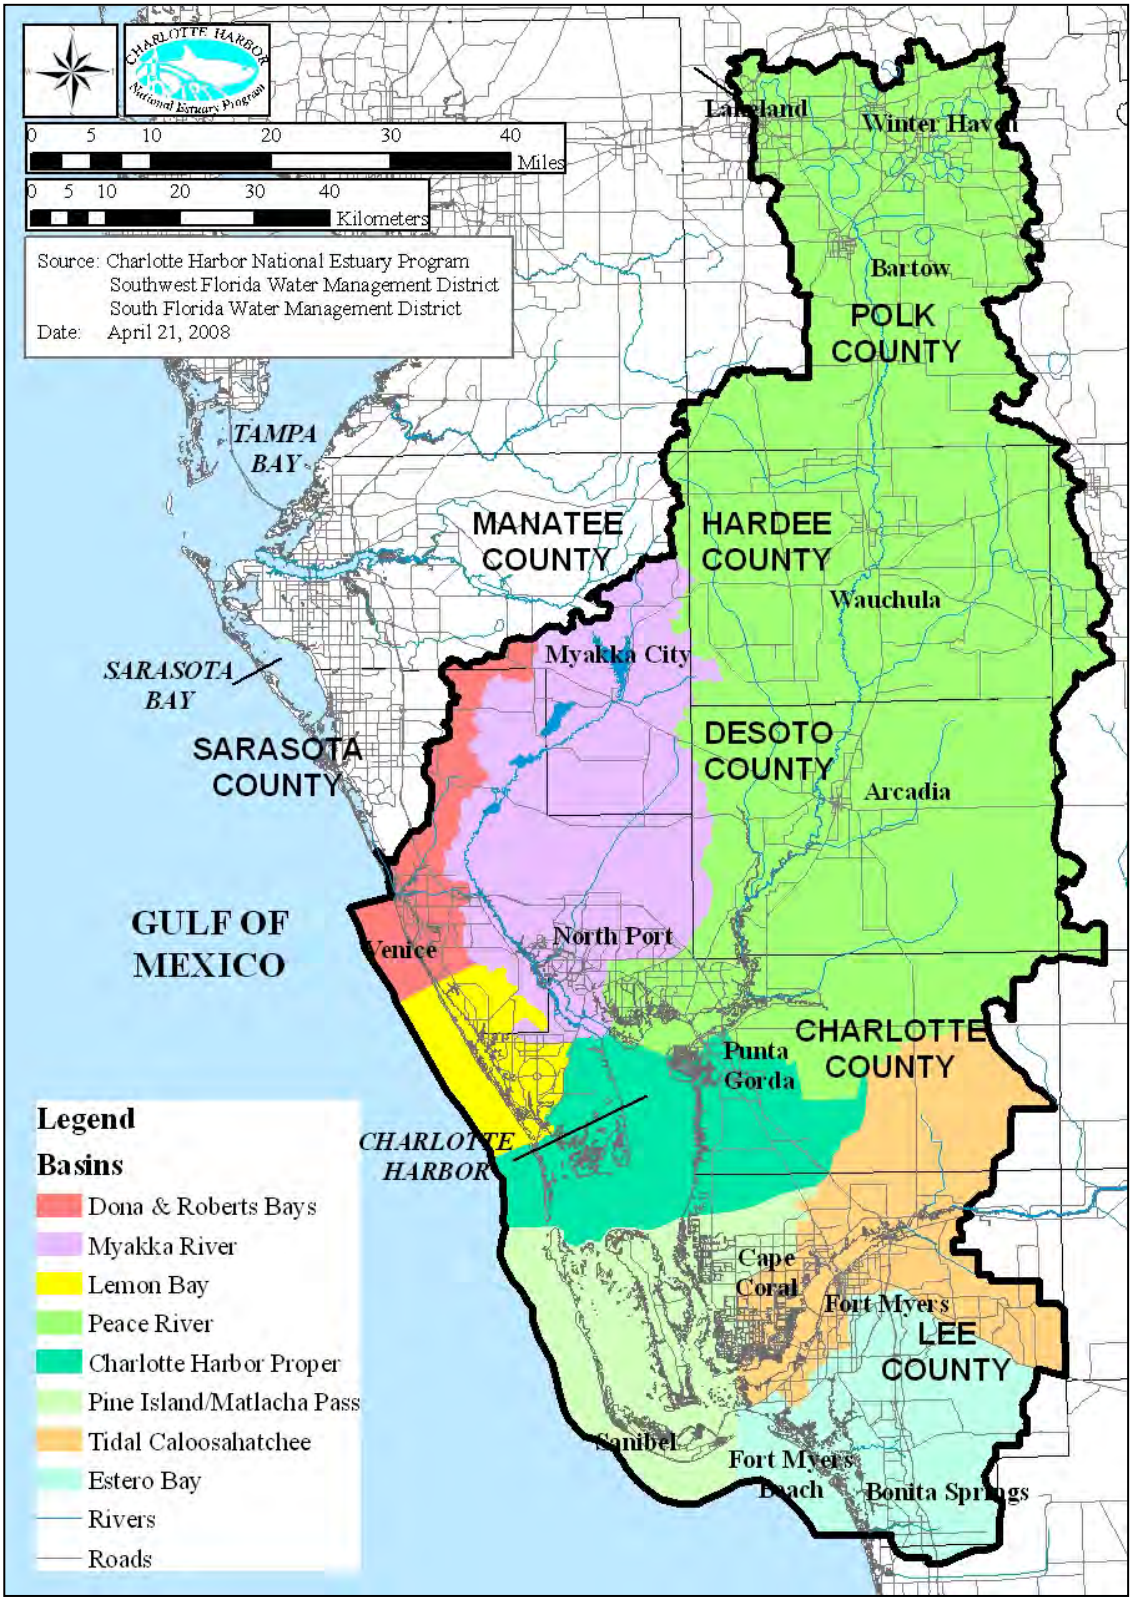

Figure 1: CHNEP Study Area

- **SG-3:** Through 2020, the CHNEP long-term monitoring strategy and data management will continue and be enhanced. The resulting Internet-based Water Atlas will be maintained systematically.
- **SG-R:** Track and present monitoring data according to CHNEP-adopted environmental indicator targets.
- **SG-S:** Post raw data, geographic information system (GIS) and technical analysis on the Internet under the data management strategy.

The original CCHMN SOPs were developed by the CHNEP with assistance from many partners from throughout the study area. These CCHMN SOP 2015 Updates are needed to incorporate changes in sampling partners, improvements in monitoring equipment and enhanced GIS mapping capabilities that have occurred since the monitoring program was initiated in 2004. Together with the original CCHMN SOPs, these updated procedures provide guidance to ensure that the CCHMN continues to provide reliable, consistent, technically sound water quality data throughout the estuarine regions of the CHNEP study area. The estuary regions (strata) within the CHNEP are shown in Figure 1.

The water quality data provided by the CCHMN is an essential component of many water quality assessments and resource management decisions throughout the CHNEP estuarine and tidal waters. The data is critical for linking development of water quality criteria with evaluation and assessment of waterbodies to determine if they are meeting regulatory requirements (Figure 2).

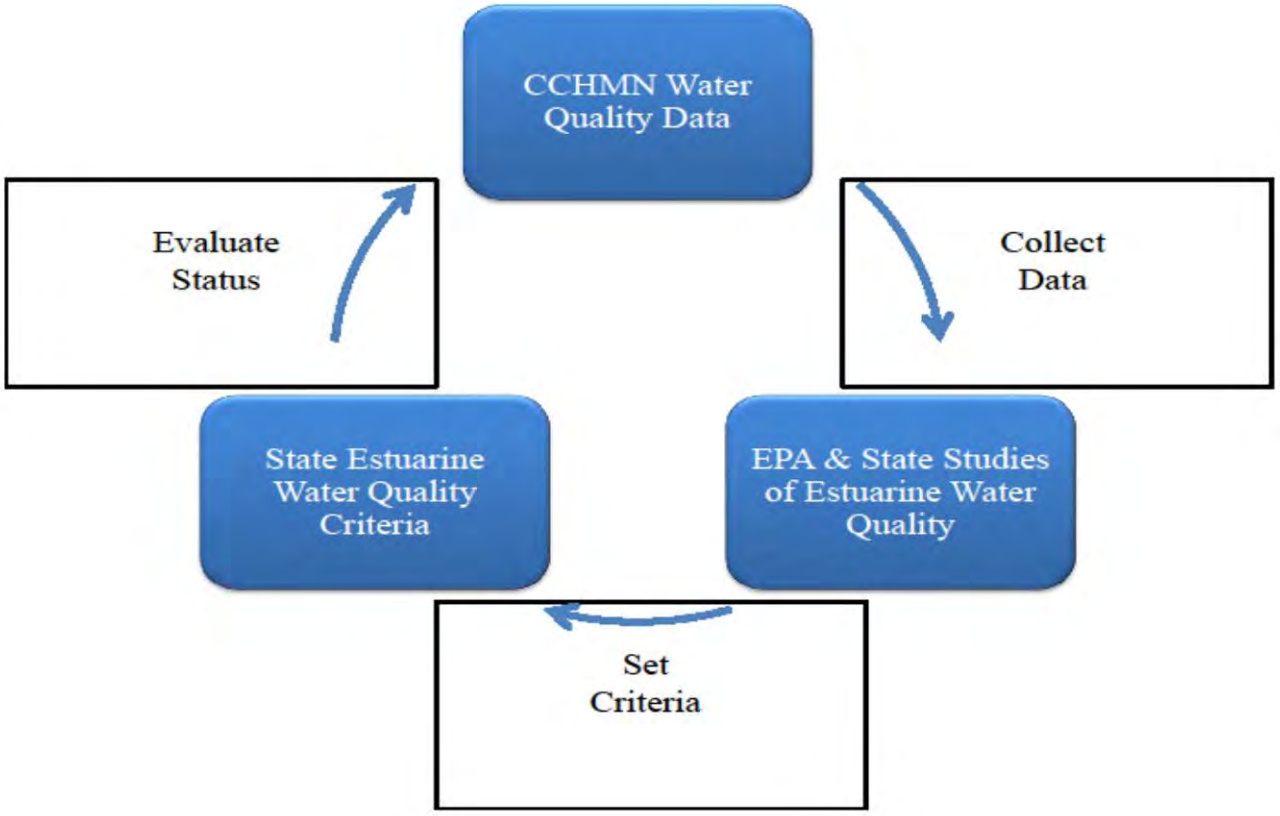

Figure 2: Uses of CCHMN Data

Specific uses of the CHNEP water quality data include:

- CHNEP Water Quality Status and Trends (Janicki Environmental, 2007),
- CHNEP Water Quality Targets (CHNEP, 2006),
- CHNEP Numeric Nutrient Criteria (Janicki Environmental, 2011),
- CHNEP Optical Model development (Dixon et al, 2014).
- State Impaired Waters and TMDL determinations,
- State BMAP processes, and
- Water Management District Minimum Flows and Levels (MFLs).

The CCHMN is currently (2015) funded by a partnership of Southwest Florida Water Management District (SWFWMD), Charlotte County, Lee County, the City of Cape Coral and CHNEP. Field sampling is conducted by Florida Fish and Wildlife Conservation Commission (FWC) Charlotte Harbor Field Laboratory, City of Cape Coral, Florida Department of Environmental Protection (FDEP) Environmental Assessment and Restoration South Regional Operations, Lee County Environmental Laboratory and CHNEP staff. Laboratory analyses are conducted by a partnership with Charlotte County (contract laboratory), City of Cape Coral Laboratory and Lee County Environmental Laboratory.

The CCHMN data is entered into the federal, state and water management district water quality data bases (including USEPA STORET, FL STORET and SWFWMD WMIS) and is available to the public and agency staff through the CHNEP Water Atlas (http://www.chnep.wateratlas.usf.edu/).

The CCHMN background information, study design and field methods are described briefly in the following sections. For additional detail, please refer to the *Coastal Charlotte Harbor Monitoring Network Description and Standard Operating Procedures* (CHNEP, 2004).

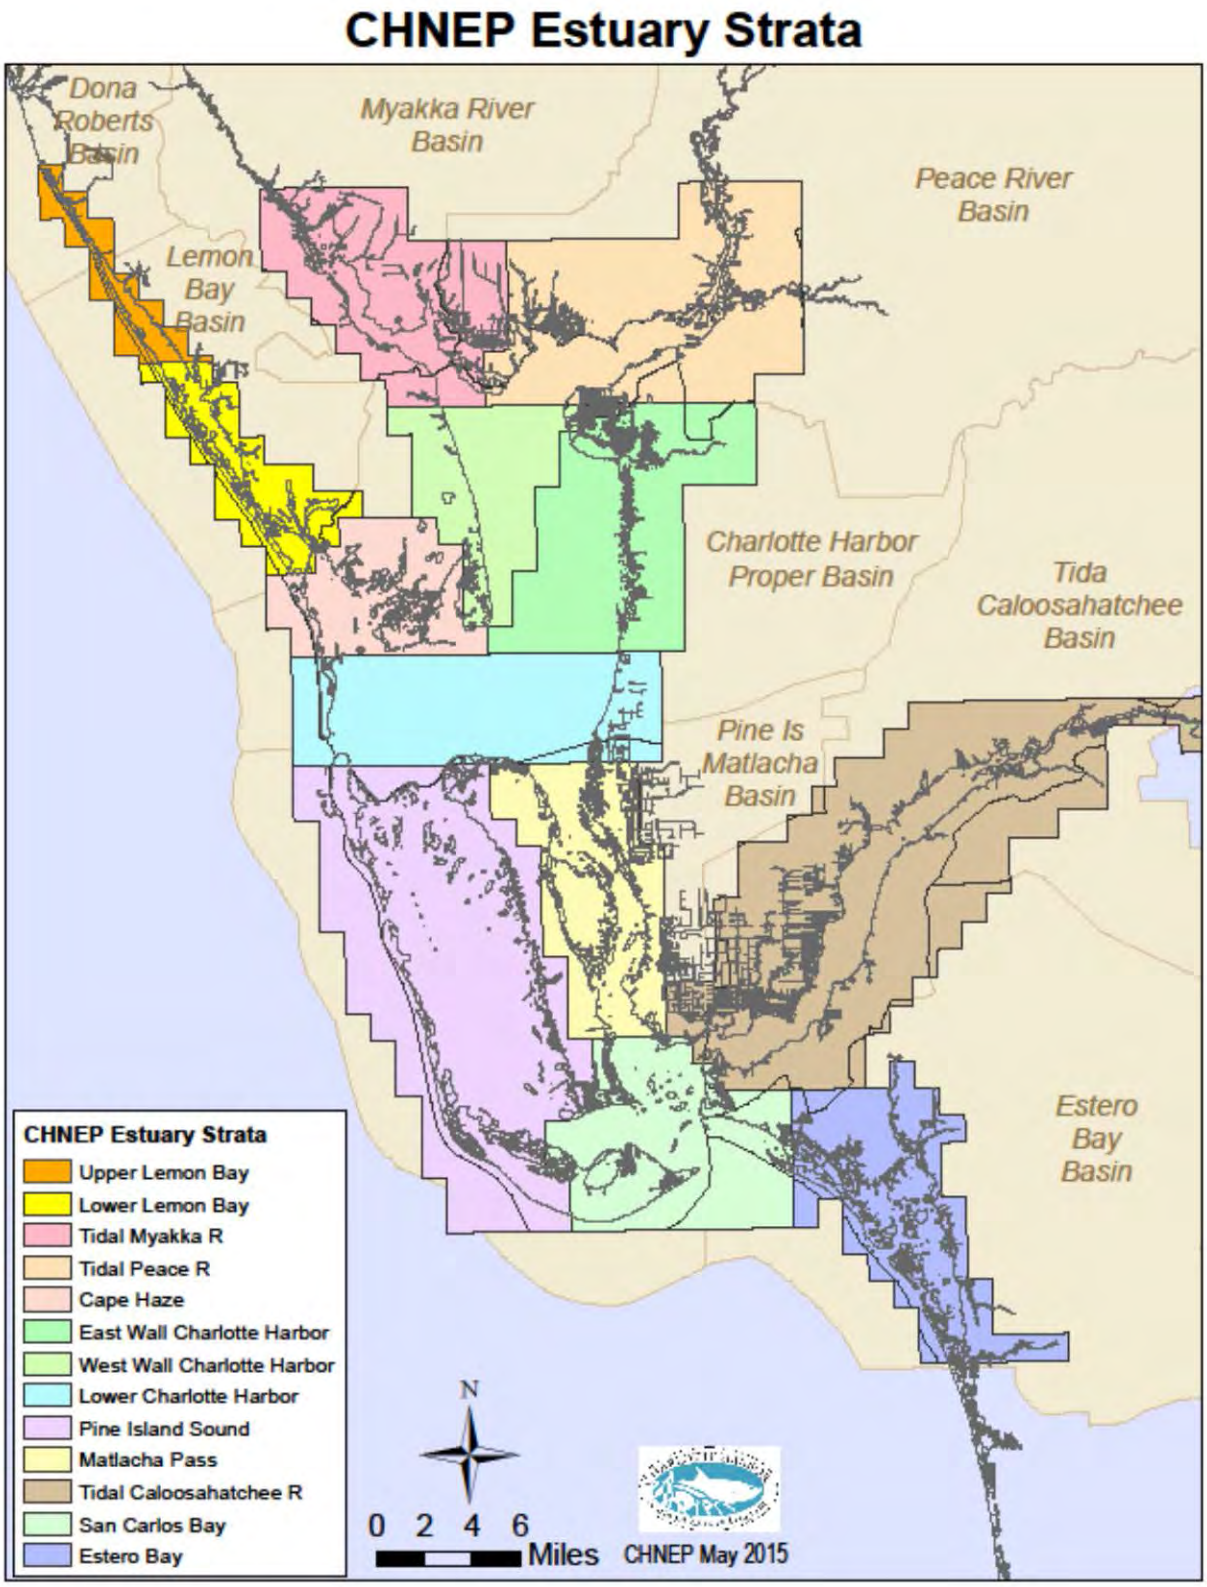

Figure 3: CHNEP Estuary Strata

Background

The original CCHMN SOPs were built on the SWFWMD *A Long-Term Water Quality Monitoring Design for Charlotte Harbor, Florida* (1995) and the CHNEP *Long Term Monitoring Strategy and Gap Analysis* (2000).

The purpose of the CHNEP Long-Term Monitoring Strategy was to track status and trends of fish and wildlife habitat, hydrologic and water quality conditions for the greater Charlotte Harbor watershed. The strategy recommended a stratified, random sampling design based on the U.S. Environmental Protection Agency's (EPA) Environmental Monitoring and Assessment Program (EMAP) for the region's coastal water quality programs. The objectives of long term monitoring strategy were to provide unbiased data that answer the following water quality questions:

a) Is water quality changing through time for a specific water body?
b) Did water quality change as the result of implementing some management practice?
c) Did water quality change by some specific target level?

The CHNEP Long Term Monitoring Strategy was developed based on a consensus approach and review of existing guidance, including EPA's Environmental Monitoring and Assessment Program (EMAP) approach. EMAP used a stratified-random sampling protocol to provide statistically unbiased results for the coastal areas.

The CCHMN was created to filled gaps in coastal water monitoring and initiate a unified approach throughout the study area. Based on extensive scientific input, the estuaries and tidal rivers of the CHNEP were divided into 13 regions of relatively homogeneous water quality and habitat conditions and overlaid with the square mile sampling grids utilized by the FWC Fisheries Independent Monitoring (FIM) sampling protocols. Within each stratum, each month five grids are randomly selected and sampling locations (latitude and longitude) within each grid are randomly selected. This allows each stratum to be monitored at 60 locations each year. The details of how and why the strata, grids, sampling frequency, sampling protocols, metadata, data analysis methods and core analytes were determined are included in the CHNEP Coastal Charlotte Harbor Monitoring Network Description and Operating Procedures (CHNEP, 2004).

One of the major goals of the CHNEP is to help facilitate inter-agency cooperation and coordination to utilize the region's assets for more collaborative natural resources management and research, including the area's monitoring programs. Charlotte Harbor covers 270 square miles and the Greater Charlotte Harbor Watershed extends over an area of 4,700 square miles. The study area includes all or part of eight counties, two water management districts, two FDEP districts, and many cities and towns. This large study area and the interconnected jurisdictions of the public and private institutions have created both management opportunities as well as critical gaps in the complex legal and organizational framework.

Water quality monitoring programs throughout the region generally consist of fixed stations that are designed to sample for analytes and in areas that are of interest to the various monitoring agencies. It can be difficult statistically to make assumptions about the condition of larger waterbodies based on limited fixed station data, though the data can be useful for regulatory purposes. In addition, between the various monitoring agencies, the number of individual monitoring sites, the frequency of the collection and the sampled analytes at each site are highly variable. Monitoring agencies also often use different protocols for lab analysis and sample collection. These inconsistencies can result in data gaps and incomparable data across basins. Inter-governmental coordination of field sampling methodologies, monitoring sites and laboratory methods throughout the southwest Florida region benefited by the creation of the Southwest Florida Regional Ambient Monitoring Program (SWF RAMP). The SWF RAMP meets quarterly to conduct split sampling for comparisons, compare split sampling laboratory results, resolve inconsistencies in results and discuss relevant emerging issues.

The CCHMN began implementation in 2001 as a cooperative monitoring network to fill gaps in water quality data in the CHNEP estuaries using a stratified, random sampling design. Initially, five strata were sampled (Tidal Peace and Myakka Rivers, Lemon Bay and Charlotte Harbor East Wall and West Wall) by five partners (SWFWMD, FWC Florida Wildlife Research Institute, FDEP Charlotte Harbor Aquatic Preserves, and Charlotte and Sarasota Counties). In 2002, seven additional stratum were added (Lower Lemon Bay, Lower Charlotte Harbor, Pine Island Sound, Matlacha Pass, Tidal Caloosahatchee River, San Carlos Bay and Estero Bay) by four additional partners (Lee County, Cape Coral, Sanibel, and SFWMD). Since the time the CCHMN was implemented, field and laboratory partners and funding sources have changes, but partners continue to work together to ensure collection of technically sound water quality using consistent methods throughout the CHNEP estuaries.

The CCHMN stratified, random sampling design includes monthly sampling within 12 estuary strata, with five randomly selected grids and sites sampled in each stratum each month. This allows for data to be collected at 60 sites per stratum per year as suggested by the CHNEP Long Term Monitoring Strategy. The sampling design results in approximately normal data distributions allowing for parametric statistical analyses to be conducted for robust comparisons of means between strata, between seasons (wet and dry), and between years.

Existing Ambient Water Quality Monitoring Programs in CHNEP

The CCHMN supplements other ongoing ambient water quality monitoring programs within CHNEP, including, but not limited to:

Canalwatch

The Canalwatch program is a fixed station, canal, monthly water quality monitoring program managed by the City of Cape Coral Environmental Resources Division in Cape Coral, Florida. There are approximately 45 sites in the Cape Coral canals. Monitoring is conducted on the first Wednesday of each month by over 50 trained volunteers. The program began in 1995 and more information is available at: http://www.capecoral.net/department/public_works/canalwatch.php#.VYxqYWfbKEU.

Charlotte County

Charlotte County Utilities conducts fixed station bi-monthly groundwater quality monitoring at approximately 85 sites, which are tidally influenced, within the County's jurisdiction. Sampling at some sites began in 2012. In addition, Charlotte County Public Works conducts quarterly surface water fixed station monitoring at 5 sites in South Gulf Cove. More information is available at: http://www.charlottecountyfl.com/CCU/WaterQuality/index.asp .

Charlotte Harbor Estuaries Volunteer Water Quality Monitoring Network (CHEVWQMN)

The CHEVWQMN is a fixed station, estuarine, monthly water quality monitoring program managed by the FDEP Charlotte Harbor Aquatic Preserves in Punta Gorda, Florida. There are approximately 45 sites from Lemon Bay through Estero Bay. Monitoring is conducted synoptically, on the first Monday of each month within 1 hour of sunrise, by over 100 trained volunteers. The program started in 1996 and more information is available at: http://www.chnep.wateratlas.usf.edu/chevwqmn/.

City of Cape Coral

The City of Cape Coral Environmental Resources Division conducts monthly water quality monitoring at approximately 35 fixed stations within the City's jurisdiction. The program began in 1989 and more information is available at: http://www.capecoral.net/department/public_works/environmental_resources_division.php#.VYxpemfbKEU.

City of North Port

The City of North Port conducts monthly water quality monitoring at 10 fixed stations as part of their SWFWMD water use permit (WUP) Hydrobiological (HB) monitoring program and the National Pollutant Discharge Elimination System (NPDES) program. The HB monitoring includes 2 freshwater sites (Cocoplum Canal and Myakkahatchee Creek upstream of the City's main dam) and 8 brackish water sites in the tidal portions of the Myakkahatchee Creek downstream of the City's main dam and the Myakka River. Data is collected for 22 parameters including nutrients. The monitoring program began in 2006 and more information is available at by contacting the City's Stormwater Manager via http://www.cityofnorthport.com/contact-us .

City of Punta Gorda

The City of Punta Gorda Utilities Department conducts monthly water quality monitoring at fixed, freshwater sites as required for the City's Water Treatment Facility consumptive use permit with the SWFWMD. The program monitors 6 fixed sites in Shell Creek and the Peace River. The program began in 1991 and is coordinated with monitoring conducted by the Peace River Manasota Regional Water Supply Authority (PRMRWSA) on a monthly frequency.

FDEP Aquatic Preserves Continuous Water Quality Datasondes

The FDEP Charlotte Harbor and Estero Bay Aquatic Preserves collect continuous water quality data using datasondes deployed in-situ at 6 fixed stations in Matlacha Pass and Estero Bay. The datasondes are fixed to pilings 0.5 m off the bottom and data is recorded every 15 minutes for 7 parameters, including temperature, turbidity, depth, pH, conductivity, salinity and dissolved oxygen. The datasondes are calibrated before deployment and remain on site for two to four weeks before being retrieved and replaced, and the data downloaded. The continuous data provides additional temporal detail to augment other existing monthly water quality monitoring programs. The FDEP continuous water quality datasonde program began in 2005 and additional information is available at: http://www.dep.state.fl.us/coastal/programs/aquatic.htm.

FDEP Watershed Monitoring Program

The FDEP formed the Integrated Water Resources Monitoring Network Committee in 1996 to develop strategies and techniques for implementing an integrated monitoring plan that would combine surface water, groundwater, and biological monitoring. The EPA, FDEP, Water Management Districts, and local governments were all asked to participate. The program subsequently established a three-tiered assessment approach. Tier 1 Status Network uses a stratified, random sampling design to characterize the overall health of Florida's water resources and observe possible trends. Tier 2 monitoring programs consist of strategically placed fixed sampling stations with the goal of further characterizing water body segments on the 303(d) list. Tier 3 monitoring programs function mainly as ongoing compliance monitoring programs and will determine if permitted facilities are in compliance with their permits. This monitoring tier provides in-depth information on individual water body segments and yields the basis for evaluating the effectiveness of the management choices relating to facilities. The program was initiated in 1996 and more information is available at: http://www.dep.state.fl.us/water/monitoring/.

Lee County

The Lee County Environmental Laboratory conducts fixed station, monthly water quality monitoring at approximately 28 estuarine sites in Pine Island Sound, Matlacha Pass and Estero Bay, and 48 freshwater sites within the County's jurisdiction. Sampling at some sites began in 2002 and more information is available at: https://www.leegov.com/naturalresources/EnvLab.

Manatee County

The Manatee County Air and Watershed Management program conducts fixed station, freshwater, monthly water quality monitoring at two permanent sites within the County's jurisdiction. Temporary sites were added as needs indicated. Monitoring records from the oldest site extends back to 1997. More information is available at: http://www.manatee.wateratlas.usf.edu/river/?wbodyatlas=river&wbodyid=14609.

Polk County

Polk County Parks and Natural Resource Division conducts fixed station, freshwater, quarterly water quality monitoring and laboratory analysis for eight sites on the Peace River and its tributaries, and in 84 public access lakes in the Peace River watershed within the County's jurisdiction. The ambient monitoring program began in 1985. Although the County program is not coordinated with monitoring conducted by the Florida LakeWatch Program, water quality data from a variety of sources can be downloaded from the Polk County Water Atlas. These data and additional information are available at: http://www.polk.wateratlas.usf.edu/.

Pond Watch

Pond Watch is a fixed station, stormwater pond, monthly water quality monitoring program managed by the Lee County Hyacinth Control District in Lehigh Acres, Florida. There are approximately 65 sites in Lee County stormwater ponds. Monitoring is conducted on the second Monday of each month by over 75 trained volunteers. The program began in 1995 and more information is available at: http://www.chnep.wateratlas.usf.edu/pond-watch-program/.

Peace River Manasota Regional Water Supply Authority (PRMRWSA)

The PRMRWSA's Hydrobiological Monitoring Program (HBMP) was initiated in 1976 and was developed by the SWFWMD and General Development Utilities, Inc. (GDU) for GDU's Peace River Regional Water Supply Facilities original consumptive use permit (1975). The PRMRWSA obtained ownership and operation of the facility in 1991. The HBMP was designed to evaluate the impacts and significance of natural salinity changes on the aquatic fauna and flora in the lower Peace River and upper Charlotte Harbor and to determine if freshwater withdrawals by the Peace River Facility could be shown to alter these patterns. The program currently includes 3 U.S. Geological Survey (USGS) water level recorders (Harbour Heights, Peace River Heights and Peace River Facility Intake) which provide surface and bottom conductivity at 15 minute intervals. The PRMRWSA also has 8 continuous recorders along the river which provide subsurface conductivity at 15 minute intervals. Monthly chemical and physical water quality measurements are conducted at four "moving" salinity-based isohaline locations (0, 6, 12 and 20 ppt) along a river kilometer center-line, running from the mouth of the Peace River upstream to Horse Creek and downstream to Boca Grande Pass. Monthly water column profiles are conducted at 16 locations along a transect running from the river mouth to the Peace River Facility. Chemical water quality samples are collected at five of these locations. Both the "moving" and fixed stations include physical *in situ* water column profile measurements (temperature, dissolved oxygen, pH, conductivity and salinity) at 0.5 meter intervals from the surface to the bottom, plus light attenuation. More information is available in the HBMP Annual Data Reports or 5 year HBMP Summary Report found in the southwest Florida Water Atlas system and also as a public document at SWFWMD or PRMRWSA.

Sarasota County

The Sarasota County Stormwater Environmental Utility conducts monthly ambient water quality monitoring of bays, creeks and the Myakka River. County bays are divided into eight segments. Each segment has one sample taken from each of five polygons and has data going back to 1995. Sixteen coastal creeks have been monitored since 2007. More information is available at: http://www.sarasota.wateratlas.usf.edu/.

South Florida Water Management District (SFWMD)

The SFWMD established a water quality monitoring program in the Caloosahatchee River in April 1999. Four fixed sites are sampled on a monthly frequency through a contract with Lee County Environmental Lab (the SFWMD has sampled eight sites off and on since the late 1980s; the four chosen for this program were part of the original eight sites). Water quality data are used to produce annual technical reports on the current status and trends of several nutrients and physical attributes of the system, provide supporting data for water supply modeling, and contribute to a growing body of regional data made available to all interested parties. More information is available at: http://www.sfwmd.gov/caloosahatchee .

Southwest Florida Water management District (SWFWMD)

This program was initiated in 1997 and currently monitors 11 fixed stations in the Peace River basin and five fixed stations in the Myakka River, either monthly or every other month. The District also collects field data for six fixed sites on a quarterly basis in Flatford Swamp in the upper Myakka watershed. SWFWMD also had numerous monthly sampled, fixed sites within the harbor itself that were revamped into the program described herein. More information is available at: http://www.swfwmd.state.fl.us/data/water-quality/.

U.S. Environmental Protection Agency (EPA)

The EPA initiated a monitoring effort in the Southwest Florida area, formerly called Coastal 2000. The objectives of the Coastal 2000 National Coastal Survey are: (1) to create an integrated comprehensive coastal monitoring program across the Nation's coastlines to assess the condition of the estuarine and coastal waters at the National, State, and Tribal scales; (2) to estimate the condition of estuarine resources for the United States, the 24 coastal states, Puerto Rico, and appropriate coastal Tribal Nations; and (3) to complete this objective with as little modification to existing State programs as possible. In 2000-2001, all 24 coastal states in the United States, and Puerto Rico were sampled to estimate the condition of their estuarine resources. The minimum number of sampling locations in each state and Puerto Rico was 50 sites located through a probabilistic design. The EPA, through an agreement with FWC Florida Fish and Wildlife Research Institute (FMRI) collected biotic condition indicator, exposure indicator, habitat indicator and stressor indicator information for Charlotte Harbor. Depending on resources, the Harbor will be re-sampled for the Coastal Assessment in future years. More information is available at: http://www.epa.gov/emap/index.html.

Coastal Charlotte Harbor Monitoring Network Study Design

Sampling Design

The CHNEP estuaries are divided into 13 strata based on those used by the FWC Fish and Wildlife Research Institute (FWRI) Fisheries Independent Monitoring program (FIM) and extensive review by the CHNEP technical community. Each stratum has relatively homogeneous water quality conditions and is divided into square mile grids, as used by FWRI FIM. Sarasota County conducts water quality monitoring in the Upper Lemon Bay stratum monthly through an ambient monitoring program. The other 12 strata are sampled monthly through the CCHMN. Within each of the 12 stratum, each month five grids are randomly selected and then sampling sites within each of the selected grid are randomly selected. This allows the CCHMN to collect data within each stratum at five sites per month, giving 60 samples per year. Throughout the CHNEP estuaries, CCHMN partners provide consistent water quality data at 60 sites per month and 720 sites per year.

The 12 strata sampled monthly by the CCHMN are shown in Figure 4 and include:

- Lower Lemon Bay
- Cape Haze/Gasparilla Sound
- Tidal Myakka River
- Tidal Peace River
- Charlotte Harbor West Wall
- Charlotte Harbor East Wall
- Lower Charlotte Harbor
- Pine Island Sound
- Matlacha Pass
- Tidal Caloosahatchee River
- San Carlos Bay
- Estero Bay

The square mile grids and numbers for each stratum are shown in Figure 5.

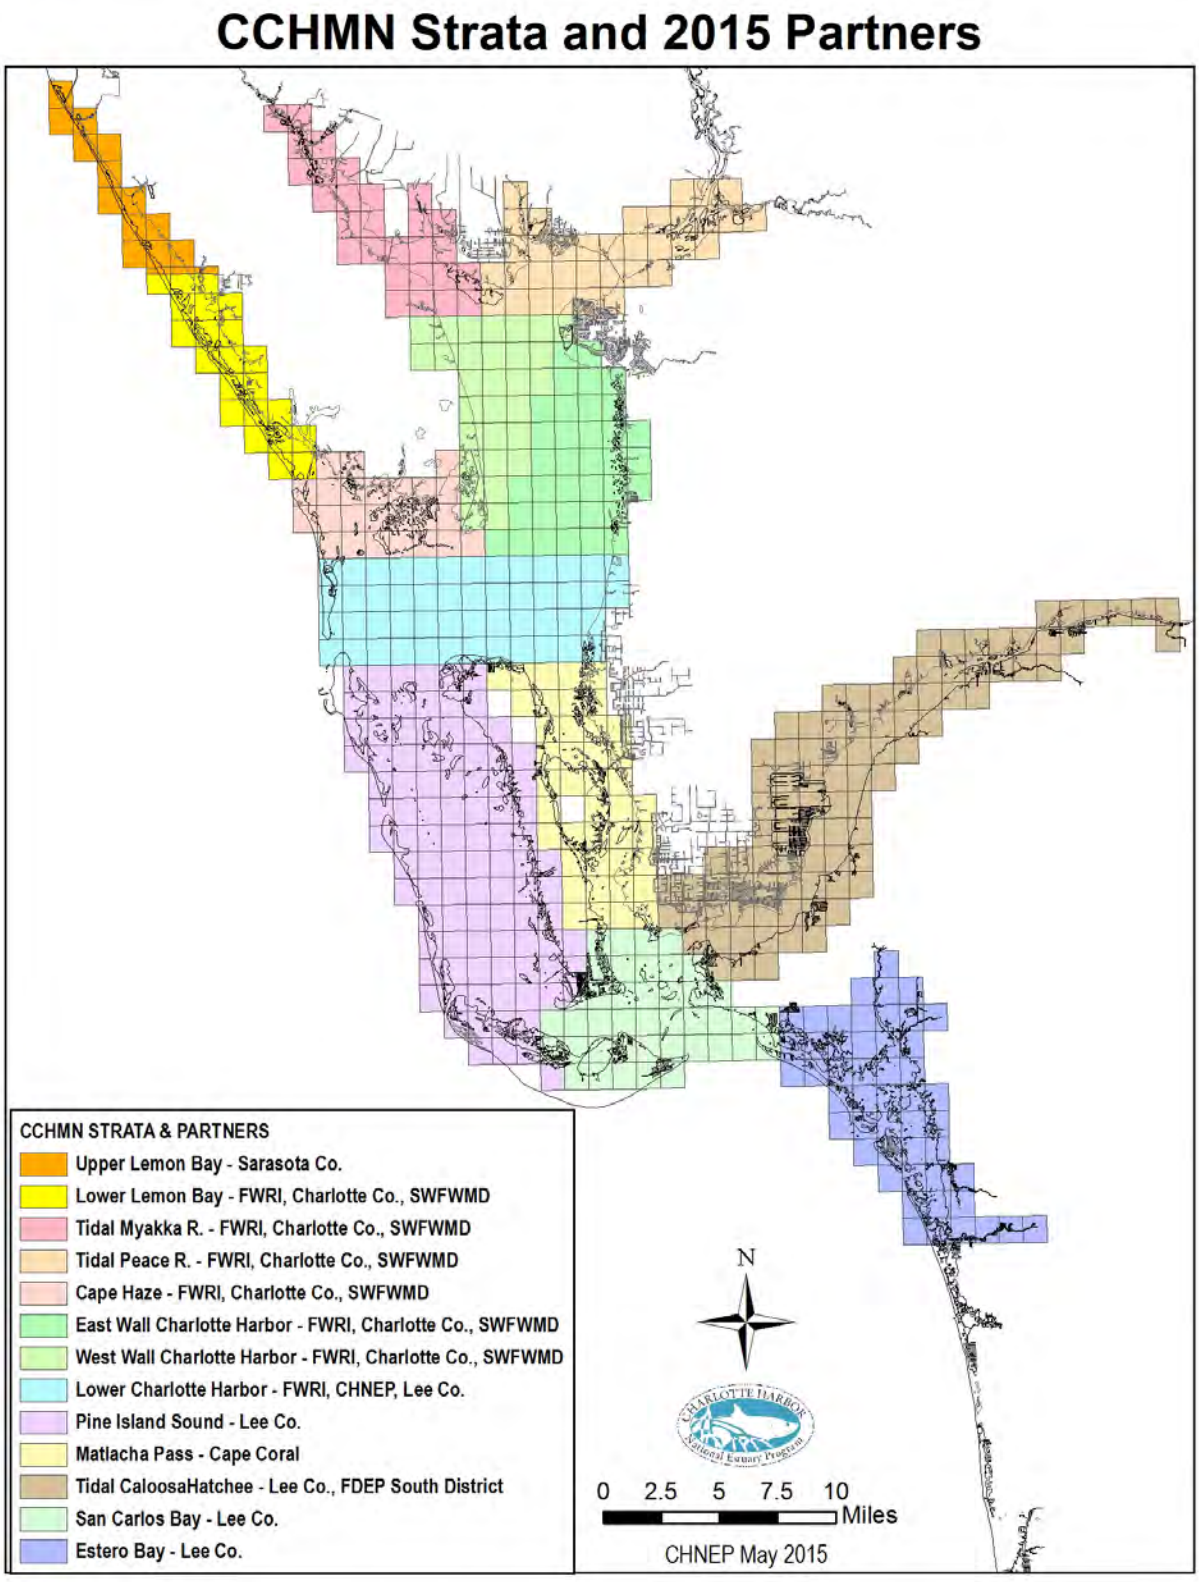

Figure 4: CCHMN Strata and 2015 Partners

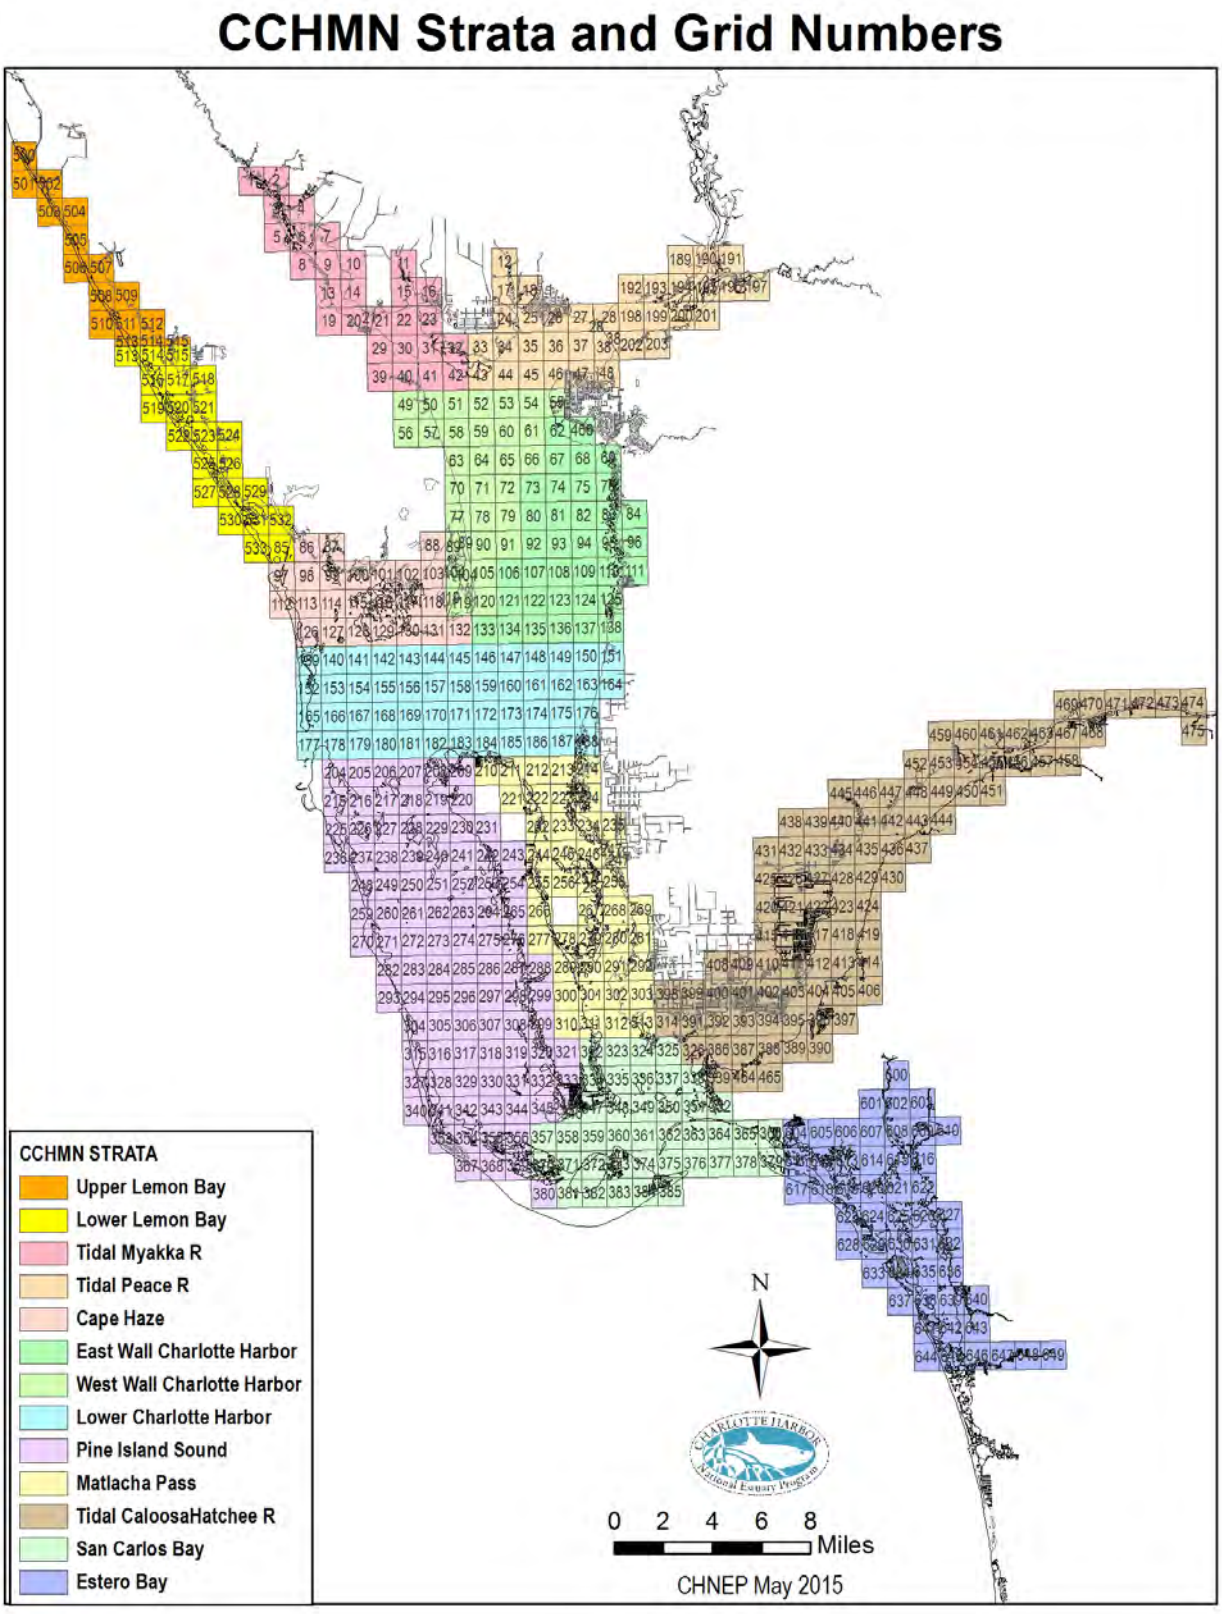

Figure 5: CCHMN Strata and Grid Numbers

CCHMN Core Water Quality Analytes for Estuaries and Tidal Rivers

The CCHMN core water quality analytes measured and collected in estuaries and tidal rivers include:

Measured In-Situ:

- Depth (m)
- Secchi disc (m)
- Light attenuation (PAR; k)
- Temperature (^{o}C)
- Salinity (ppt)
- Specific conductance (µS)
- Dissolved oxygen (DO) (mg/L)
- pH (pH units)

Water Samples Collected for Laboratory Analyses:

- Color (PCU) (SM2120B)
- Specific Conductance (µS) (SM212510B)
- Turbidity (NTU) (SM2130B, EPA180.1)
- Total suspended solids (TSS) (mg/L) (SM2540D, SM182540D, SM212540D, EPA160.2)
- Total organic carbon (TOC) (mg/L) (SM205210B)
- Chlorophyll a (mg/L) (corrected for phaeophytin) (SM1200H, SM1200M, EPA445.0, Strickland & Parsons)
- Total nitrogen (TN) (mg/L) (calculated)
- Total Kjeldahl nitrogen (TKN-N) (mg/L) (SM 4500NH3F, EPA351.2)
- Total ammonia nitrogen (mg/L) (SM4500NH3F, SM4500NH3G, SM4500NH3H, SM184500NH3C, EPA350.1)
- Total nitrite plus nitrate nitrogen (mg/L) (SM4500NO3F, SM184500N3, EPA353.2)
- Dissolved orthophosphate (OP) (mg/L) (SM4500PE, SM184500PF, EPA365.1, EPA365.3)
- Total phosphorus (TP) (mg/L) (SM184500PF, SM4500PE, EPA365.1, EPA365.3, EPA365.4)

For water quality samples, a single sample will be collected at 0.5 meters below the surface for those locations where the bottom depth is less than 3.0 meters. For locations where the bottom depth is greater than 3.0 meters, two samples will be collected (0.5 meters below the surface and 0.5 meters above the bottom). Light attenuation coefficients will be taken at 0.5 meters and 1.0 meters below the surface and above the bottom, for sites greater than 1.3 meters deep.

Field Sampling and Laboratory Analysis Responsibilities

Currently (2015) the CCHMN field and laboratory partners are shown in Figure 4 and include:

- Lower Lemon Bay - field sampling by FWRI and laboratory analyses by Charlotte County contract laboratory.
- Cape Haze/Gasparilla Sound - field sampling by FWRI and laboratory analyses by Charlotte County contract laboratory.
- Tidal Myakka River - field sampling by FWRI and laboratory analyses by Charlotte County contract laboratory.
- Tidal Peace River - field sampling by FWRI and laboratory analyses by Charlotte County contract laboratory.
- Charlotte Harbor West Wall - field sampling by FWRI and laboratory analyses by Charlotte County contract laboratory.
- Charlotte Harbor East Wall - field sampling by FWRI and laboratory analyses by Charlotte County contract laboratory.
- Lower Charlotte Harbor - field sampling by FWRI and laboratory analyses by Lee County Environmental Laboratory.
- Pine Island Sound – field sampling and laboratory analyses by Lee County Environmental Laboratory.
- Matlacha Pass – field sampling and laboratory analyses by the City of Cape Coral.
- Tidal Caloosahatchee River – field sampling by FDEP Division of Environmental Assessment and Restoration, South Regional Operations and laboratory analyses by Lee County Environmental Laboratory.
- San Carlos Bay – field sampling and laboratory analyses by Lee County Environmental Laboratory.
- Estero Bay – field sampling and laboratory analyses by Lee County Environmental Laboratory.

Field sampling will be conducted according to the CCHMN Field Sampling Procedures described in the following sections. All laboratories involved in the CCHMN will follow all applicable Federal and State guidelines for quality assurance and quality control of water quality analyses, including the use of appropriate duplicate samples and equipment blanks. It is strongly recommended that these laboratories be certified by the National Environmental Laboratory Accreditation Institute (NELA TNI) and meet FDEP laboratory certification requirements.

Project Management

The Program Manager for the CCHMN is the CHNEP Program Scientist. The Program Scientist coordinates data collection and management with CCHMN partners. Each month, CCHMN partners will be responsible for selecting random sampling grids and sites, conducting field measurements and recording results on field data sheets, collecting water quality samples, transporting samples to the laboratories for analysis, downloading data and providing copies of the field data sheets and data bases to appropriate data managers. To ensure data comparability, CCHMN quality assurance activities include: annual field audits conducted with each sampling partner; field and laboratory partners' participation in the SWF RAMP quarterly meetings and split-sample analyses; and CHNEP Management Conference review of data and statistical methods during regular water quality status and trends reporting. It is anticipated that further quality assurance measures will be implemented in the future as needed.

Field Audits

The CHNEP Program Scientist will be responsible for performing annual field audits for sample collection for each sampling agency. The results of these audits will be presented at an annual CCHMN meeting for this express purpose as well as resolve outstanding issues.

Data Ownership

The data owner for each stratum will be responsible for data handling and uploading their respective data into the State and Federal STORET (Storage and Retrieval) water quality data bases. The current (2015) data owners for each of the CCHMN Strata are:

- Upper Lemon Bay – SWFWMD and Charlotte County
- Lower Lemon Bay – SWFWMD and Charlotte County
- Cape Haze – SWFWMD and Charlotte County
- Tidal Myakka River – SWFWMD and Charlotte County
- Tidal Peace River – SWFWMD and Charlotte County
- Lower Charlotte Harbor – Lee County Environmental Laboratory
- Pine Island Sound – Lee County Environmental Laboratory
- Matlacha Pass – Cape Coral Environmental Resources
- Tidal Caloosahatchee River – Lee County Environmental Laboratory
- San Carlos Bay – Lee County Environmental Laboratory
- Estero Bay – Lee County Environmental Laboratory

Data owners may assign the uploading of data to STORET to the certified lab undertaking the laboratory analysis of their field samples as part of a contract, but the data owner is ultimately responsible for ensuring this process is fulfilled.

Links to the CCHMN data on agency websites include:

- SWFWMD: http://www.swfwmd.state.fl.us/data/water-quality/.
- Lee County Environmental Laboratory: http://leegis.leegov.com/surfwater/
- FDEP STORET: http://storet.dep.state.fl.us/DearSpa/default.do?page=waterdata; (CCHMN OrgID numbers begin with CHNEP).

Data Management

The CCHMN data will be maintained and uploaded to STORET by data owners. The data will be available to public and partnering agencies at all times. The CHNEP Program Scientist will assist CCHMN partners and University of South Florida staff with uploading CCHMN data to the CHNEP Water Atlas (http://www.chnep.wateratlas.usf.edu/) to facilitate public access to the data.

Data Analysis

The CHNEP will regularly analyze the CCHMN and make the results publicly available through the CHNEP Website (www.chnep.org) and Water Atlas **(**http://www.chnep.wateratlas.usf.edu/ **).** In addition, 10-year time series analyses of three parameters, TN, chlorophyll *a* and DO, are available on the CHNEP Water Atlas (http://www.chnep.wateratlas.usf.edu/water-quality-trends/).

Water quality status and trends reports incorporating the CCHMN data include:

- CHNEP Water Quality Status and Trends (Janicki Environmental, 2007)
- CHNEP Water Quality Targets (CHNEP, 2006)
- CHNEP Numeric Nutrient Criteria (Janicki Environmental, 2011)
- CHNEP Optical Model development (Dixon et al, 2014)

Participation in the Regional Ambient Monitoring Program (RAMP)

All participating CCHMN laboratories and field monitoring agencies will participate in Southwest Florida Regional Ambient Monitoring Program (SWF RAMP) quarterly meetings and inter-laboratory split-sample exercises to help ensure data comparability region-wide. The SWF RAMP serves as a quality assurance forum for comparing split-sample laboratory results, resolving inconsistencies in results and discussing pertinent water quality monitoring issues throughout the region.

Coastal Charlotte Harbor Monitoring Network Field Sampling Procedures

Sample Collection

A. Site Selection:

- Five sites per stratum will be sampled each month.
- Five grids per stratum will be randomly selected and sampling locations within each selected grids will be randomly selected.
- Sampling sites will be chosen and mapped prior to field sampling (see below for procedure).
- Alternate sites can be chosen if the water depth at the site is too shallow or it is not possible to access the site.

B. Sample Acquisition:

- Water samples shall be collected by using an horizontal sampling device, such as an Alpha or Niskin bottle, preferably opaque.
- All appropriate sample bottles shall be filled in the order listed below and labeled properly.

C. Blank, Duplicate and Split Samples:

- An equipment blank will be taken every sampling trip.
- Optionally (preferred) one duplicate every 10 sites or one every sampling trip will be taken.
- Split samples for the testing the precision of lab analysis is optional.

D. Use of Protective Gloves: FDEP recommends wearing protective gloves when conducting all sampling, but, their use is not mandatory. Use gloves if sampler has come in contact with potential contaminants (i.e., sun tan lotion, outboard motor oil):

E. Container and Equipment Rinsing: When collecting aqueous samples the sample collection equipment and non-preserved containers shall be rinsed three times with sample water before the actual sample is taken. This protocol shall not be followed for sample containers with pre-measured preservatives in the container (acidified bottles).

F. Dedicated Equipment Storage: All dedicated equipment shall be stored in a clean environment, protected from dirt and other sources of TN, TP, and TSS contaminants.

G. Fuel-powered Equipment and Related Activities: All sampling is done away from fuel-powered equipment activities. Samplers will make every effort to observe winds, currents and other parameters to ensure no contamination.

H. Preservation - All samples shall be preserved by the certified lab involved in the Network and delivered to the sampling entity, ready for use.

Decontamination

A. Equipment Preparation: All equipment shall be cleaned in a controlled environment and transported to the field pre-cleaned and ready to use.

- All equipment must be immediately rinsed with water after use, as specified below. Field cleaned equipment (alpha bottle, pump tubing and re-usable filters) shall be cleaned between samples.
- Alpha bottles shall be cleaned with ambient sample water, while the pump tubing and re-usable filters shall be cleaned with deionized water (between samples).
- Proper cleaning protocol, upon return to the field lab, is followed.
- Detergents used shall be Liquinox (or equivalent) or Alconox (or equivalent).
- Deionized water is used as the final rinse for all cleaning (suitable for only inorganic analyses (metals, nutrients, etc.).

Aqueous Sampling Procedures

A. General: There are several requirements that are common to all types of surface water sampling events and are independent of technique. Several of these requirements are concerned with sample parameters that are inherently difficult to sample. In addition to the below procedures, overall care must be taken in regards to equipment handling, container handling/storage, decontamination, and record keeping.

- Sample collection equipment and non-preserved sample containers must be rinsed with sample water before the actual sample is taken.
- If protective gloves are used they shall be clean, new and disposable. These should be changed prior to the next sampling site.
- If possible, one member of the field team should take all the notes, fill out tags, etc., while the other member does all of the sampling. To ensure sampling precision, each member should continue to assume the same duties for the entire sampling trip, especially secchi disk readings.

B. Sampling Site Access: Access will be left up to the sampling group. Ease of access should not be the main criteria for sampling site choice. If sampling by boat, there are certain precautions that must be considered:

- If sampling with a boat, samples should be taken from the bow, away and upwind from any gasoline outboard engine.
- Every effort will be taken to prevent contamination. (Charlotte Harbor –FWC-FMRI— has mid-hull engines and does sampling behind the outboard and fuel tank. Winds, currents and boat position shall be taken into account when sampling, in order to meet these criteria.)
- Care should be taken not to disturb sediments when motoring to the sampling sites (especially shallow water sites).

C. Site Selection: Five sites per stratum per month will be sampled. Samples shall be randomly selected for every month and every stratum.

- Each month, five random grids (1 X 1 nautical mile) within each stratum will selected using a random number generator or other program.
- Each grid within each stratum is numbered and a GIS layer of the grid coordinates and numbers for each of the 13 strata is available from the CHNEP office (Figure 5).
- Using the randomly selected grids for each stratum, the latitude and longitude coordinates for the sampling locations within that grid will be randomly selected using a GIS or other program.
- The sampling site latitude and longitude coordinates will be recorded in a format using degrees and decimal minutes 0.001 decimal minutes (i.e.: 26^{o} 43.369'; -82^{o} 05.794').
- Every attempt to collect samples from the pre-selected sites should be made.
- Both selected and actual sample locations should be recorded on the datasheets. Any alteration from the pre-selected site will be noted.
- Site changes will be done in this order:
  - If site is too shallow or on land, then movement from the selected site toward the Intracoastal Waterway or center of grid until appropriate depths are achieved (1.0 m in Charlotte Harbor, tidal Peace and Myakka rivers; 0.7 m in Lemon, San Carlos and Estero Bays; 0.7 m in Bokeelia section of Charlotte Harbor, Pine Island Sound, Matlacha Pass and tidal Caloosahatchee River).
  - If the grid has a deeper area, and no channel nearby, movement will be made toward that area until depths are achieved.
  - If the area is shallow and the knowledge of the grid dictates that water level (or other factors) will not allow for sampling, then an alternate grid can be chosen.
  - Priority of the grid selection should include (region/stratum is first, Grid is next, sample area is last.
- If alternate sites are sampled,
  - sampling must not be done more than once per grid,
  - the grid must remain in the same region or strata,
  - the closest grid to the original grid should be chosen unless conditions in surrounding grids are similar

D. Sample Acquisition: Water samples will be collected by using a horizontal sampling devise, such as an Alpha or Niskin bottle, opaque if possible, with depths taken from the center of the container. Sample acquisition will follow these procedures:

- The initial grab is taken at 0.5 m below the surface.
- If the sample site > 3m, then an additional sample is taken at 0.5 m above the bottom.
- Once the sampling device is triggered and sample is trapped, the sample is brought on board.
- The proper order for filling sample bottles is as follows: non-preserved, preserved and finally filtered samples.
- Filtered samples (NH3 and Orthophosphate) shall be collected by a peristaltic pump or syringe-filter combination. All filters will be 0.45 microns.
- The tubing for the peristaltic pump is rinsed with the sample water (through the spigot).
- Non-preserved bottles will be rinsed with sample water prior to filling
- Ensure all caps are tightened prior to placing sample bottles in ice chests.
- Once filled, all bottles shall be put in ice in sampling coolers, except the chlorophyll bottles. The chlorophyll bottles shall be laid on top of the ice to avoid temperature shocking, and then put into the ice once cooled, for transport to the laboratory.

E. Data Measurements and Recording – Each member of the field sampling team will conduct the same tasks throughout the sampling event. One field sampler will record environmental parameters, light attenuation measurements, multi-parameter sampling meter (Hydrolab or YSI) readings, Secchi disks values and any other pertinent information needed. Measurements will be taken and recorded as following:

- Secchi disk depths shall be taken on shady side of boat without the use of sunglasses, and light meter readings will be taken on sunny side of boat.
- Multi-parameter sampling meter values (pH, DO, salinity, pH, temperature) shall be recorded to the nearest 0.01 values, except conductivity, which is recorded to the nearest unit.
- Values shall be measured and recorded at 0.5 m below the surface at all sites.
- Values shall be measured and recorded at 0.5 m above the bottom for sites deeper than >3m depths, and optionally for all sites >1.5 m.
- Values may also optionally (preferred) be measured and recorded at 1 m depth profiles throughout the water column at sites >3 m.
- Depths shall be recorded from the probes, not the bottom of the instrument.
- Bottom composition information (mucky, sandy, submerged aquatic vegetation, hard bottom or unknown) will be recorded.
- Additional information is recorded as per the datasheet (see attachment).
- An example CCHMN field data sheet is shown in Appendix A.

F. Light Measurements: Light attenuation readings will be taken and recorded using a Licor according to the following these procedures:

- Underwater sensors may be 2 pi (flat) or 4 pi (round). It is preferable to use similar sensors throughout the CCHMN, but 2 pi sensors may be used in the SWFWMD strata and 4 pi sensors may be used in the SFWMD strata.
- Light meter measurements will utilize one air sensor and two underwater sensors mounted 0.5 meters apart on a PVC pole frame with depths accurately and clearly marked.
- Before each sampling event, the light meter underwater sensor readings will be validated by taking simultaneous readings in the air and recording the values for each sensor on the data sheet, so that the readings may be used as correction factors during data analysis as needed. The most effective way to accomplish this is to hold the PVC frame out of the water, pointed directly towards the sun.
- During field sampling at each site, light meter measurements will be recorded simultaneously for the one air sensor placed on a level surface on the boat and the two underwater sensors with the PVC pole frame held vertically in the water without shading the sensors by the boat, equipment, submerged aquatic vegetation or algae.
- Underwater light measurements will be taken at depths of 0.5 m (and 1.0) m below the surface at all sites.
- Underwater light measurements will also be taken at depths of 0.5 m and 1.0 m above the bottom for sites >2 m, and optionally (preferred) at 1.0 m increments between the surface and bottom measurements at sites >3 m deep.
- In rough waves, the PVC pole frame with the underwater sensors will be held with the appropriate depth mark held as stable as possible at the water surface. The most effective way to accomplish this is to have the person holding the PVC pole frame lean over the water, ensuring all safety precautions have been met, and act as a “gimbal” as the boat moves under them.
- The light meter data logger will be set to average readings every 5 seconds and the data will be recorded after the readings stabilize (about 30 seconds).
- A data qualifier will be used to record bottom composition information (mucky, sandy, submerged aquatic vegetation, hard bottom or unknown), especially when using a 4 pi sensor over white, sandy sediments.

Sample Transport

Each laboratory will provide sampling field staff with pre-labeled bottles and equipment as needed. Field sampling staff will arrange for water samples to be delivered to the laboratory within that allotted sample holding time. Sample transport will follow appropriate Chain of Custody procedures between field and laboratory partners, including proper sample preservation and temperature requirements. Chain of Custody forms will be kept on file with the laboratories, available on request.

Budget

The current (2015) CCHMN estimated budget is shown in Table 1.

Agency	Strata	Field Sampling	Laboratory Analyses	Funding Mechanism	Agency Total
Southwest FL Water Management District	Lower Lemon Bay; Cape Haze; Tidal Myakka, Tidal Peace, Charlotte Harbor East & West Walls	Conducted by FWRI. $55,500	Conducted by Charlotte Co. Contract Lab. $0	Cooperative Agreement with CHNEP & contract with FWRI.	$55,500
FWC FL Fish & Wildlife Research Institute	Lower Lemon Bay; Cape Haze; Tidal Myakka, Tidal Peace, Charlotte Harbor East & West Walls	Conducted by FWRI. 7 strata X 5 samples/strata X 12 months $0	Conducted by Charlotte Co.
